Warehouse Safety-MHE

Microshare's smart PPE and traffic solution for retrofitting Material Handling Equipment (MHE)

Warehouse Safety-MHE can prevent tragic and often lethal accidents between heavy machinery and people in a warehouse, loading dock, tarmac or other workplaces.

Warehouse Safety-MHE uses wearable devices that are provided to all staff and visitors to alert drivers of the presence of pedestrians. Warehouse Safety-MHE can be easily attached to existing machines and provides a 360-degree view of their environment. This can be done at a fraction of the cost of replacing existing equipment.

Accidents involving pedestrians and forklifts are the most common warehouse occurrences

The challenge

OSHA reports that in the US alone, there are over 61,000 injuries each year caused by forklifts colliding with pedestrians, and one in six workplace fatalities involves forklifts.

The solution

Warehouse Safety-MHE warns forklift truck drivers of immediate proximity to pedestrians with wearable safety devices.

The outcome

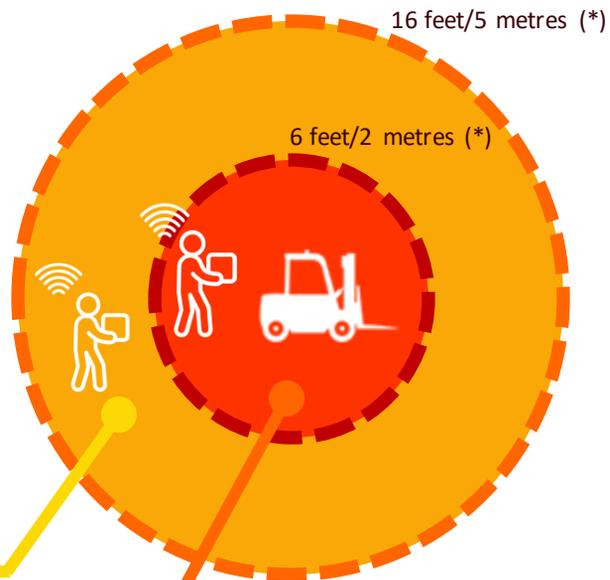

Reduces the number of forklift-related accidents and injuries while avoiding costly litigation and disruption, as well as prevent unexpected increases in insurance premiums.

How does it work?

WARNING ZONE
MHE driver gets a warning

ALARM ZONE
MHE driver wristband vibrates and event is recorded

(* The radius of both zones is configurable by Microshare to fit the warehouse specific needs
